

CalScope - California's COVID-19 Antibody Study

Your Participation Matters!

Why is CalScope important?

CalScope is a study about COVID-19 antibodies, which are proteins produced by the body in response to the virus that causes COVID-19 (either through past infection or vaccination). This information about antibodies can help public health leaders understand how the COVID-19 virus has spread throughout California. CalScope will also help the California Department of Public Health (CDPH) better understand which communities remain at-risk for COVID-19 and how COVID-19 will continue to impact California.

CDPH needs your help!

Your participation helps ensure that a large and diverse group of Californians is included in this study about antibodies. If you received an invitation, that means your household was randomly selected from millions of other addresses to represent your county. Your participation will help local health programs get a better idea of how a population's immunity, or level of protection against the COVID-19 virus, may be different across specific groups including children, working adults, and older adults with underlying medical conditions. Your participation can also help CDPH understand how immunity to COVID-19 in California has changed because of the Delta and Omicron variants.

We can't do this without you!

Results from this study can help:

- Estimate how many people in the community have COVID-19 antibodies (from vaccination, a previous infection, or both).
- Identify areas or communities with high amounts of missed COVID-19 infections.
- Identify groups that might need additional resources.

**Participation in this study is free and confidential.
Households can earn up to \$80 in gift cards for participating!**

If you received an invitation, visit www.CalScope.org and click "I got an invitation" or call 1-833-580-1333 to sign up today!
